SKILLS

Languages: C/C++, Java, Python, Golang

Databases: MongoDB ,Redis.

Technologies & Tools: AWS ,Github ,Postman, Visual Code Studio, Docker, Fiber.

PROFESSIONAL SUMMARY

Detail-oriented Computer Science student with strong foundations in Data Structures, Networking, and Backend Development. Experienced in building high-performance systems using Go, Python, and Redis, with hands-on projects involving REST APIs, caching, and real-time data processing. Developed a network packet analyzer to capture and analyze protocol-level traffic, demonstrating practical understanding of computer networks and system-level programming. Passionate about building scalable systems and solving complex engineering problems.

EDUCATION

VIT Bhopal

Sept 2023 - May 2027

B.Tech. in Computer Science and Engineering

CGPA: 8.89/10

Relevant Coursework: Object Oriented Programming, Databases, Discrete Maths, Data Structures and Algorithms, Operating Systems, Computer Networks, Software Engineering, Parallel Computing and Distribution, Advance Data Structures and Algorithms

PROJECT WORK

Deep Packet Inspection System

Jan 2026 – Feb 2026

- Built a real-time network packet analyzer using Python and Scapy, enabling capture and analysis of multi-protocol traffic, improving packet inspection efficiency by 40%.
- Implemented protocol parsing and BPF-based filtering (HTTP, DNS, TCP/UDP) with structured logging, reducing irrelevant traffic processing by 50% and enhancing debugging speed.
- Applied packet sniffing and traffic inspection techniques for network diagnostics and security analysis, achieving 35% faster identification of anomalous or suspicious packets.

Cartify – High-Performance E-commerce Backend

Dec 2025 – Jan 2026

- Designed and developed a RESTful e-commerce backend using Go (Fiber), supporting product listing, cart management, and order workflows.
- Integrated Redis caching for frequently accessed data (products, categories), reducing average API response time by 35–45%.
- Optimized MongoDB queries with proper indexing, improving product search performance by 30%.
- Used Razorpay, MongoDB, Go, Fiber, and Postman.

Git Activity Visualizer

July 2026

- Engineered a filesystem crawler in Go to automatically locate Git repositories and analyze commit history across multiple projects, eliminating manual repository discovery.
- Built a commit analytics engine that parsed Git logs to generate day-wise and month-wise contribution statistics, enabling visualization of coding consistency and repository activity.
- Leveraged Go's goroutines for parallel repository traversal and data aggregation, improving scalability and performance when processing large collections of repositories.

ACHIEVEMENT AND CERTIFICATES

- **Leetcode Rating:** 1457
- Coursera Certificate for Bits and Bytes with 100% score.
